NATIONAL RESIDENT MATCHING PROGRAM

The National Resident Matching Program was established in 1952 to provide both applicants and residency program directors a fair opportunity to consider their options for appointment, to make reasoned decisions and to have their decisions announced at a specified time. A brief introduction is followed by the presentation of the results of the NRMP for 1993/94 appointments in graduate medical education.

The first Match was conducted in 1952 when 11,000 internship positions were available for 6,000 U.S. By 1973 there were 19,000 graduating seniors. positions for just over 10,000 U.S. graduating seniors. Following the demise of the internship in 1975, the number of first post graduate year (PGY-1) positions dropped to 16,000. The number of PGY-1 positions has gradually increased to reach 20,598 in the 1993 Match [(Figure 1, inside cover) and (Table 1)]. U.S. graduating seniors reached a high in 1985 when 16,179 enrolled in the Match. A small decrease in the number of U.S. graduating seniors occurred each year between 1986 and 1990. The first increase since 1985 was seen in 1991 when 15,268 U.S. seniors enrolled. After another decline in 1992 the number of U.S. seniors again rose to 15,386 for this year's Match (Table 2).

Tables 1 and 2 illustrate the trends in the number of PGY-1 positions and the number of applicants participating in the Match during the past decade. Many applicants, in addition to U.S. senior medical students, seek residency positions through the NRMP. The different categories of applicants are shown in Table 2. This year, due to pending changes in

Canadian residency requirements, the significant increase in Canadian participants was offset by a much greater increase in the number that withdrew prior to the Match. While U.S. graduates and osteopathic physicians can be appointed outside of the matching program, program directors increasingly have required these applicants to participate in the Match especially if they are seeking a PGY-2 position, which, while being offered in the 1993 Match, will not begin until July 1994. The low Match rates for PGY-1 positions for these applicants should be interpreted with this fact in mind. U.S. and non-U.S. foreign medical graduates can also be appointed outside of the Match; however, program directors and applicants are insured of obtaining their most desirable match if they participate fully in the process.

Of particular note is the 43.6% increase in the number of non-U.S. foreign trained physicians who registered for the 1993 Match, resulting in a substantial increase (35.1%) in the number that submitted Rank Order Lists (Active). However, as there was not a corresponding increase in the number of available positions, their success in being matched to a position declined from 63.0% in 1992 to 58.4%.

The ratios of positions to active applicants from 1971 through 1993 are shown in Table 3. This table has been revised from prior issues and no longer attempts to report ratios of positions to U.S. citizens, a data element which is not available and was assumed in the past to equate with U.S. seniors, which is not completely accurate. The ratio of PGY-1 positions per active U.S. senior declined from 2.0:1 in 1973 to a low of 1.2:1 in 1985. Since then it has gradually increased to 1.5:1 in 1992 and remains the same for 1993. The ratio of such positions to total applicants is quite different. With the influx of applicants who are not U.S. seniors the ratio of PGY-1 positions to applicants has declined from a high of 1.8:1 in 1971 to a low of 0.8:1 in 1984. In the current Match the ratio stands at slightly less than one position for each active applicant.

Table 4 has also been revised from prior issues and now shows the fluctuation of match rates for U.S. seniors, U.S. FMGs (U.S. citizens trained in foreign medical schools), Non-U.S. FMGs (non-U.S. citizens trained in foreign medical schools), and Others, a category which includes Canadian, Osteopathic, 5th Pathway and U.S. physicians. The match rate for U.S. seniors has fluctuated only slightly from a low of 92.1% in 1982 to a high of 94.0% in 1987. In the current Match, their match rate was 92.4% as it was in 1992. The match rates of foreign trained physicians, however, is very different and is clearly directly related to the ratio of available positions per applicant. From 1983 to 1987, when the number of positions was less than the number of total active applicants, their match rates were well below 50%. In 1993, as applicants again exceed positions, their match rates declined.

Tables 5 and 6 represent the PGY-1 positions offered and filled in each specialty participating in the NRMP from 1987 through 1993. Table 5 depicts the number of positions offered by specialty and shows the number filled by U.S. seniors and by total applicants. It should be noted that although there has been a slight, but steady, increase in the total number of first year positions offered in the Match, the number filled by U.S. seniors has dropped from 13,596 in 1987 to just under 13,000 in 1990 and has stabilized at this number through the 1993 Match. The total number of positions filled, however, was 16,013 in 1987 and although it has fluctuated, it has risen to 16,896 in the current Match. Table 6 provides the same information on positions offered, but indicates the percentage of positions filled in each specialty by U.S. seniors and total applicants. The overall filling of PGY-1 positions declined from a high of 84.1% in 1987 to a low of 77.6% in 1991, rising again to 82.0% in 1993. There were declines in the fill ratios for individual specialties, not only in the number of U.S. seniors but also, in some cases, their total number filled. The increase in the number and corresponding percentage of U.S. seniors matching to positions in Family Practice, from 1,398 in 1992 to 1,636 in the 1993 Match, may indicate a response to the need for more primary care physicians. However, this is not supported by the steady decline of U.S. seniors in Internal Medicine. The statistics also indicate that the decline in Internal Medicine is compensated for by an increase of non-U.S. seniors being matched into positions. Furthermore, the "leakage" of Internal Medicine residents into medical sub-specialties, makes it difficult to determine the impact of PGY-1 numbers on eventual numbers of generalists. General Surgery, Psychiatry and Transitional Programs also show a decline of U.S. seniors being matched and an increase in the number of non-U.S. seniors. Only the surgical and support specialties appear to have escaped this trend and continue to maintain more of a constant mix. Of those specialties offering a significantly large number of positions in the 1993 Match, only Obstetrics and Gynecology, Orthopedic Surgery, Emergency Medicine and Diagnostic Radiology continued to maintain fill rates above 95%.

Table 7 shows the total number of applicants and the percentages that matched to PGY-1 positions by specialty. One can see a decline in the percentage of total applicants that matched into Family Practice from 1984 until 1992 with an upswing in 1993. There has

also been a relatively constant percentage matching to Internal Medicine, Pediatrics and the Medical Specialties. Psychiatry, on the other hand, increased from 4.1% in 1984 to 5.8% in 1988 and then declined to 4.0% in 1993. General Surgery shows a decline from 13.0% of the total applicants in 1984 to only 10% in 1993. Similarly, Transitional Programs have declined from a high of 6.8% of the total applicants to 6.1% in 1993. The Support Specialties, on the other hand, have increased from a low of 7.1% in 1986 to 10.3% in 1993.

Table 8 represents the total number of U.S. seniors and their corresponding percentages matched to PGY-1 positions by specialty. Here again is evidence of the decline in the percentage matched into Family Practice from 13.0% in 1984 through 1992 and their increase Pediatrics 12.6% in 1993. and to Obstetrics/Gynecology both show a slight but steady rise, with Pediatrics increasing from 9.4% in 1984 to 10.5% in 1993 while Obstetrics/Gynecology rose from 6.2% in 1984 to 7.5% in 1993. General Surgery also declined from 13.5% of the total number of U.S. seniors matched in 1984 to only 10.7% of those in the 1993 Match. The Support Specialties, strongly influenced by the growth in the number of U.S. seniors matching into Emergency Medicine and Diagnostic Radiology which offset the decline in the matched into PGY-1 programs of number Anesthesiology, enjoyed an increase from 8.5% in 1984 to 10.9% in 1993 of the newly graduating U.S. seniors.

Table 9 is similar to Tables 7 and 8, but pertains only to foreign trained physicians excluding Canadian and applicants from Fifth Pathway programs. One can see the reverse of some of the trends reflected in U.S. seniors. Internal Medicine's decrease in the number of U.S. seniors matched is countered with an increase in foreign trained physicians from 41% of such in 1984 to 59.6% in 1991. With the increase in foreign trained physicians participating in the Match, the percent of such matching to Internal Medicine has declined in the past two years to 57.8% of all positions obtained by foreign trained physicians. In numbers they have increased by 608 positions; a 57.2% increase. As might be expected, specialties that have experienced increases in U.S. seniors have a corresponding decrease in the number of foreign trained physicians matched.

Table 10 has also been revised from prior issues. No longer does it attempt to indicate the number of applications filed by applicants, information which is not reported to the NRMP, but rather reports the total number of programs ranked by the applicants. Hence, an applicant ranking ten different programs would contribute a count of ten to the total. The headed RANK/POSITIONS column therefore indicates a measure of the average number each position was ranked. If one examines Table 11, which shows the number of applicants who actually ranked a specialty, one can compute the approximate number of programs ranked by each applicant. For example, 8.397 Family Practice programs were ranked by U.S. seniors. Table 11 shows that 1,832 U.S. seniors ranked at least one family practice program or an average of 4.6 programs per applicant. Table 10 also outlines the distribution of PGY-2 programs offered and filled for appointments beginning July 1994. Applicants matched to these positions will do a year of board clinical training, generally in a preliminary program such as Internal Medicine, General Surgery or Transitional. This year there were 413 programs offering 2,158 PGY-2 positions, up from 344 programs and 1,954 positions offered in last year's Match.

Table 11 reports the choices of U.S. seniors and

Independent Applicants by specialty. It includes the choices of all applicants without regard to whether the applicants were matched or unmatched. The specialty groups include all program tracks, as well as the advanced programs offered in each specialty. For example, Internal Medicine includes Preliminary, Primary and Categorical as well as Medicine-Pediatrics and Medicine-Psychiatry. A comparison of the total number of U.S. students choosing or ranking Plastic Surgery for example, reveals that there were three times as many U.S. senior applicants as there were positions. In contrast, there were over twice as many positions offered in Psychiatry than there were U.S. seniors seeking such a position.

Table 12 examines the population of U.S. seniors who chose to rank only one type of specialty. This includes 84.6% of all seniors submitting a Rank Order List. High unmatched rates, such as seen for Obstetrics and Gynecology (20.3%), Orthopedic Surgery (23.7%), Plastic Surgery (25.0%) and General Surgery (15.2%) reflect that there are more applicants than there are positions. It is understandable that their total PGY-1 "fill ratios" (Table 6) were 98.3%, 99.4%, 88.0% and 76.8% respectively.

Table 13 shows the number of U.S. seniors who matched to their first, second, third, fourth, fifth or lower ranked programs. The percentage of seniors matching to each of those choices has changed little in the history of the Match, in spite of efforts to encourage seniors to reach higher by ranking first their most desirable program without regard to whether or not they will be ranked highly by the program. One should also note that since 1991, Table 13 includes PGY-2 positions as well as PGY-1 and reflects the fact that in the 1993 Match, 1,248 seniors obtained PGY-1 as well as PGY-2 positions and both are included in the statistics. Table 14 provides the total positions, both PGY-1 and PGY-2, offered by specialty and the number of applicants by type who matched in each state.

Additional Information

Since May 1989, the Association of American Medical Colleges (AAMC) assumed the management responsibilities for the NRMP. As of July 1, 1992 the NRMP office in Evanston, Illinois was closed and the operation was moved and incorporated into the AAMC's Section for Student Services in Washington, D.C. Data derived from NRMP has been integrated into the AAMC's Student and Applicant Information Management System (SAIMS). Studies are routinely conducted on the characteristics and career development of graduates pursuing various specialties from the time they enter medical school through their post graduate training. Special data requests, pertaining to this or prior matches, can be accommodated and should be directed in writing to:
